

Suppose machine A is selected again and
reward = 4.

$$N(A) = 2$$

Previous: $Q(A) = 3$

$$Q(A) = 3 + \frac{1}{2}(4-3)$$

$$Q(A) = 3 + 0.5$$

$$Q(A) = 3.5$$

Total reward after these two plays:

$$3 + 4 = 7$$

Final values after two plays

$$N(A) = 2$$

$$R(A) = 3 + 4 = 7$$

$$Q(A) = 3.5$$
